Will not except orders for less than \$1.00. If wanted shipped by Parcel Post please send postage. Our responsibility ceases upon delivery to forwarding companies. Claims for damages are to be made upon latter.

LIABILITY—We are not liable for injury to or loss of stock from any cause beyond our control. We give no guarantee that our stock will live and grow, but we do guarantee our stock to be well rooted, well grown, true to name as delivered to us, and well packed for shipment. Claims for shortages must be made at once.

We invite you to come see us at any time, and will appreciate an order from you at any time. Over 20 years of faithful service to the public makes this list possible for which we thank our many friends very much, and will thank you all again and again.

Yours very truly,
Guildford, Whitfield Nursery.

CAMELLIA JAPONICA

The Camellia Japonica has long been acclaimed the "Aristocrat of the Southern Garden" and has in recent years gained popularity in the floral trade. Blooming at a time when the garden is otherwise barren and its great range of forms and colors make the Camellia Japonica the most sought after plant today.

Camellia grows in almost any soil, but well drained good garden soil a little acid in reaction is more suitable. A semi-shady location is preferable, especially when the plants are young. Free blooming cannot be expected in complete shade.

The root system of the Camellia is rather coarse and does not transplant as easily as the Azalea. Being a gross feeder, it responds well to fertilization. At the time of planting, if the soil is not fertile enough, use a mixture of one-half of garden soil, one-fourth of wellrotted stable manure and one-fourth of peat or leaf mold. Every winter or early spring apply well rotted cow manure, bone or cotton seed meal or similar commercial fertilizer. Mulching with half rotted leaves or peat is also beneficial. As the Camellia thrives in a humid atmosphere attention should be given to watering. Frequent syringing on the leaves helps a great deal during the dry summer months.

Proper pruning is also essential; water shoots, dead or injuder branches and branches growing too close together should be pruned with care. General pruning should be done during the month of February so as to have the least effect on the flower buds.

Red spider and various scales may attack Camellias, but can be easily controlled. We have been using "Volck, Jr." or "Florida Volck" at the ratio of 1 to 50, adding one to two teaspoonful of Black Leaf Forty eo every gallon of solution. Avoid, if possible, spraying in the late Fall or during the winter as a severe freeze causes much damage. This is especially true when an oil spray is used.

Remarks:
